                                                                                                                                                                                                                                          ø
                                                                                                                                                                                                      The present sequence encodes a cyclohexadepsipeptide synthetase polypeptide. The specification describes a method for producing heterologous polypeptide. The method comprises cultivating a mutant of a parent filamentous fungal cell, which produces less cyclohexadepsipeptide than the parent filamentous fungal cell which produces less cyclohexadepsipeptide than the parent filamentous fungal cell when production of biologically active compounds e.g. antibiotics.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence encodes an enzyme which has cyclosporin synthetase-
like activity. This sequence was isolated from Tolypocladium niveum
(formerly known as T. inflatum GAMS). The enzyme encoded by this
sequence catalyses the peptide biosynthesis of cyclosporins and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  structurally related molecules. This sequence may be used for the production of cyclosporin by transforming a vector containing this sequence in to a recombinant host. This allows effective production of antibiotic cyclosporin or its derivatives.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                gene from T. vasinfecta. This fragment was isolated using primers derived from the Tolypocladium niveum (formerly known as T. inflatum GAMS) exclosporin synthetase gene, corresponding to bases 40309-40328 and 42018-41999. The T. niveum gene encodes an enzyme which catalyses the peptide biosynthesis of cyclosporins and structurally related molecules. The T. niveum sequence may be used for the production of cyclosporin by transforming a vector containing the gene sequence in to a recombinant host. This allows effective production of antibiotic cyclosporin or its derivatives.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       GCTATCAACCATTCGGTCCAGCGCCGAGGGCGACTCATCATCATTCCGTTCCCGACATCTT

to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence encodes an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic
for antibiotic development. The antisense nucleic acids can also be used

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faccalis. The invention is also useful for the identification of potential new targets
                                                                                                                                                    TGGACACTCTCTCTTGGCCACGAAGCTCATTTCTCGTATCGACCAACGACTCAAGGTCCG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The specification describes a DNA sequence which partially encodes the dinctional portion of polypeptide component required for synthesizing the polyketide antibiotic Tel-Aviv, postmodification of antibiotic Tel-aviv, or regulation of blosynthesis of antibiotic Tel-aviv. The antibiotic Tel-aviv is a macrocyclic polyketide synthesised through the incorporation of acetate, methionine, and glycine. It inhibits cell wall synthesis by interfering with the polymerisation of the lipid-disaccharide pentapeptide. Antibiotic Tel-aviv genes are useful in combinatorial genetics, and for encoding protein components for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel DNA sequence involved in polyketide antibiotic Tel-Aviv production useful for inhibiting cell wall synthesis and in wide range of clinical applications such as treating gingivitis
                                                                                                                         method allows access to the reservoir of genetic diversity in soil pathogenic micro-organisms, in order to find new antibiotics. It also allows access to novel biosynthetic genes/enzymes that can be used to produce antibiotics or produce specific compounds, enzymatically,
                                                                                                                                                                                                                                                                                                                                        596 CGCCATCGAAGTCCGCGAGAGGCTTCGGTCCTTACTTCCATCGTACATGATCCCATCGAA
                                 This sequence encodes a peptide synthase clone, isolated from soil. This protein is used in a method for the recovery of antibiotic biosynthetic DNA from humic materials or lichen. The PCR products of invention have the potential to be used as therapeutic molecules including antibiotics, immunosuppressors and antitumour agents. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel DNA sequence (I) whose expression products effect or are involved in the enzymatic biosynthesis. In the state of betapolyketide or heteropolyketide compounds (II). (I) can be inserted into an expression vector and used to transform or transfect prokaryotic or eukaryotic cells with the aim of obtaining strains that produce large amounts of polyketide or heteropolyketide compounds, especially epothilones, which have cytotoxic and/or immunosuppressant and antibiotic and antifungal activities and are useful; as plant-protection agents. This sequence represents the DNA sequence isolated from Sorangium cellulosum which is described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DNA sequence coding for products involved in the biosynthesis of polyketide or heteropolyketide compounds, especially epothilone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DB 21; Length 37856;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 37856 BP; 5655 A; 13666 C; 12913 G; 5622 T; 0 other;

 synthesis, modification and regulation of antibiotic antibiotic Tel-aviv.
                 Antibiotic Tel-aviv is useful in a wide range of clinical applications such as treating gingivitis. Antibiotic Tel-aviv is also useful for generating new biological agents from its secondary metabolites. The present sequence encodes a protein involved in synthesis of antibiotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Polyketide biosynthesis; heteropolyketide biosynthesis; mutasynthesis; epothilone; cytotoxic; immunosuppressant; antibiotic; antifungal;

                                                                                                                                                                                                                                                                               The present sequence represents the BLM (Bleomycin) gene cluster, containing open reading frames (ORFs) 31-40. The proteins encoded by the gene cluster are useful for producing peptides and/or polyketide metabolites, especially bleomycin or bleomycin analogues. They are also useful for chemically modifying biological molecules to produce branched methyl groups, and for coupling amino acids and fatty acids. They may be reacted with an apo-carrier protein and coenzyme A to produce a holo-carrier protein. The BLM gene cluster or catalytic domains can be used individually or collectively to produce thiazolidine, thiazoline, bithiazolime and bithiazolime-containing minicabial metabolites. The BLM gene cluster may also be used to produce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               4758 GGTGGTCGTCCTGGAGGCGCTGCCACTGACGGAAAGCTGGAACGCTGGACGCCGCGCCT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention describes a method of monitoring differential expression of genes in a first Bacillus cell relative to expression of the genes in conter Bacillus cells. Comprising hybridising labelled nucleic acid probes isolated from Bacillus cells to a substrate containing array of Bacillus gene expression by an observed hybridisation reporter signal of a spot in the array. The method is useful for measuring the expression of genes in a first Bacillus cells. The method is useful for monitoring of spot in one or more second Bacillus cells. The method is useful for monitoring global expression of several genes from a Bacillus cell, discovering new genes, identifying possible functions of unknown open reading frames and monitoring gene copy number variation and stability. Monitoring changes in expression of genes may be used to provide a representation of the way in which Bacillus cells adapt to changes in culture conditions, and in which Bacillus cells adapt to changes in culture conditions, conviconmental stress or other physiological provocation. Extensive follow-up characterisation is unnecessary, when one spot on an array equals one gene or one open reading frame, since sequence information is the method of the invention.

The method of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  3721

The invention describes a method of monitoring differential expression of genes in a first Bacillus cell relative to expression of the genes in conter Bacillus cells, comprising hybridising labelled nuclaic acid probes isolated from Bacillus cells to a substrate containing array of Bacillus genewrespienby an observed hybridisation reporter signal of a spot in the array. The method is useful for measuring the expression of genes in a first Bacillus cells relative to expression of the same genes or more second Bacillus cells. The method is useful for monitoring genes, identifying possible functions of unknown open reading frames and monitoring gene copy number variation and stability. Monitoring cenes, identifying possible functions of unknown open reading frames and monitoring gene copy number variation and stability. Monitoring changes in which Bacillus cells adapt to changes the culture conditions, in which Bacillus cells adapt to changes the culture conditions, conviconmental stress or other physiological provocation. Extensive follow-up characterisation is unnecessary, when one spot on an array equals one gene or one open reading frame, since sequence tag (GST) used in the method of the invention.

The specification describes a method for the preparation of a collection of nucleic acids from organisms in a soil sample. The method comprises milling a dried sample to produce microparticles; suspending these in liquid buffer: extraction of nucleic acids from the microparticle; passing nucleic acid-enriched fractions through a molecular sleve; passing nucleic acid-enriched fractions through a maion exchange chromatography material; and recovering fractions containing purified nucleic acids. The nucleic acids are sources for sequences that encode either operons involved in a metabolic pathway (specifically polyketide synthesis) or polypeptides, particularly for production of therapeutic or agricultural compounds, especially polyketide antibiotics. AAF90034.39 represent open reading frames (ORFS) of the coding strand of cosmid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        4216
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1277 GAAGCATTCACGCCTCCGGAAACTCCGGTGGAACAGGTACTCGCCCACATTGGGGCGAG 4336

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             690 AATGGTAAAGTTGACCGGAAGGAACTCTCTCGCAGGCCAAAGGTTGTACCGAAGCAGCAG 749
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The specification describes a method for the preparation of a collection of nucleic acids from organisms in a soil sample. The method comprises milling a dried sample to produce microparticles; suspending these in liquid buffer; extraction of nucleic acids from the microparticle; passing nucleic acid-containing solution through a molecular sieve; passing nucleic acid-enriched fractions through a molecular sieve, chromatography material; and recovering fractions containing purified nucleic acids. The nucleic acids are sources for sequences that encode either operons involved in a metabolic pathway (specifically polyketide synthesis) or polypeptides, particularly for production of therapeutic a agricultural compounds, especially polyketide antibiotics. The present sequence represents cosmid a2691 coding strand), which encodes different
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pernodet J, Guerineau M, Simonet P, Courtois S;

The nucleic acids are sources for sequences that encode either operons involved in a metabolic pathway (specifically polyketide synthesis) or polypeptides, particularly for production of therapeutic or agricultural compounds, especially polyketide antibiotics. The present sequence represents cosmid asofgi (non-coding strand). The sense strand encodes different polyketide synthases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The specification describes a method for the preparation of a collection of nucleic acids from organisms in a soil sample. The method comprises milling a dried sample to produce microparticles; suspending these in

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.
